CYCLE 1: Basic programs using datatypes, operators and control statement in java

Program 1.1	**Date: 01/01/2024**
Write a Java program to check whether a string is palindrome or not.	

PROGRAM :

```
import java.util.*;

public class P7_1_palindrome {
	public static void main(String args[]) {
		Scanner s = new Scanner(System.in);
		int i;
		boolean flag = true;
		try {
			System.out.println("\nEnter a string to check for palindrome : ");
			String str = s.nextLine();
			str = str.toLowerCase(); // coverts entered string to lowercase

			// Comparing one character at a time till middle of the string is reached
			for (i = 0; i < (str.length() / 2); i++) {
				if (str.charAt(i) != str.charAt(str.length() - i - 1)) {
					flag = false;
					break;
				}
			}
			if (flag) {
				System.out.println("\nstring " + str + " is Palindrome.");
			} else {
				System.out.println("\nstring " + str + " is Not Palindrome.");
			}

		} catch (Exception e) {
			System.out.println("\nError : " + e);
		}
	}
}
```

OUTPUT :

```
E:\MCA\SEM 2\JAVA PROGRAMMING (MCA202)\JAVA LAB>java P7_1_palindrome

Enter a string to check for palindrome :
malayalam

string malayalam is Palindrome.

E:\MCA\SEM 2\JAVA PROGRAMMING (MCA202)\JAVA LAB>
```

Program 1.2	Date: 02/01/2024

Write a Java program to multiply two matrices.

PROGRAM :

```
import java.util.*;

public class P7_2_matrix_multiply {
	public static void main(String args[]) {
		Scanner s = new Scanner(System.in);
		int row1, col1, row2, col2;
		int i, j;
		try {
			// MATRIX 1
			System.out.println("\nEnter the number of rows of First    matrix :");
			row1 = s.nextInt();
			System.out.println("\nEnter the number of columns of First    matrix :");
			col1 = s.nextInt();

			System.out.println("\nEnter the Elements of First    matrix : ");
			int[][] matrix1 = new int[row1][col1];
			for (i = 0; i < row1; i++) {
				for (j = 0; j < col1; j++) {
					matrix1[i][j] = s.nextInt();
				}
			}

			// MATRIX 2
			System.out.println("\nEnter the number of rows of Second    matrix :");
			row2 = s.nextInt();
			System.out.println("\nEnter the number of columns of Second    matrix :");
			col2 = s.nextInt();

			System.out.println("\nEnter the Elements of Second    matrix : ");
			int[][] matrix2 = new int[row2][col2];
			for (i = 0; i < row2; i++) {
				for (j = 0; j < col2; j++) {
					matrix2[i][j] = s.nextInt();
				}
			}

			// no.of columns of First matrix and no.of rows of Second matrix should be
same
			// for matrix multiplication posssible.
			if (col1 != row2) {
				System.out.println("\nMatrix multiplication is not possible !");
			} else {
				// RESULT MATRIX
				int[][] result_matrix = multiply_matrix(matrix1, matrix2);
```

```
                System.out.println("\nResult Matrix is --->");

                for (i = 0; i < row1; i++) {
                    for (j = 0; j < col2; j++) {
                        System.out.print(result_matrix[i][j] + "\t");
                    }
                    System.out.println("\n");
                }
            }

        } catch (Exception e) {
            System.out.println("\nError : " + e);
        } finally {
            s.close();
        }
    }

    public static int[][] multiply_matrix(int[][] matrix1, int[][] matrix2) {
        int row1, col1, col2;
        int i, j, k;
        row1 = matrix1.length;
        col2 = matrix2[0].length;
        col1 = matrix1[0].length;

        int[][] result = new int[row1][col2];

        // multiplying
        for (i = 0; i < row1; i++) {
            for (j = 0; j < col2; j++) {
                for (k = 0; k < col1; k++) {
                    result[i][j] += matrix1[i][k] * matrix2[k][j];
                }
            }
        }
        return result;

    }
}
```

OUTPUT :

```

CYCLE 2: Object Oriented Concepts

Program 2.1	Date: 16/01/2024

Write a Java program to calculate the area of different shapes namely circle, rectangle, trapezoid and triangle. (Use the concepts of JAVA like *this* keyword, constructor overloading and method overloading)

PROGRAM :

```
import java.util.Scanner;

class AreaCalculator {
	// Circle
	public double calculateArea(double radius) {
		return Math.PI * radius * radius;
	}

	// Rectangle
	public double calculateArea(double length, double width) {
		return length * width;
	}

	// Trapezoid
	public double calculateArea(double base1, double base2, double height) {
		return (base1 + base2) * height / 2;
	}

	// Triangle
	public double calculateTriangleArea(double base, double height) {
		return 0.5 * base * height;
	}
}

public class P8_1_area_of_shapes {
	public static void main(String[] args) {
		Scanner scanner = new Scanner(System.in);
		AreaCalculator areaCalculator = new AreaCalculator();
		int choice = 0;
		do {
			System.out.println("\nChoose a shape to calculate its area:");
			System.out.println("1. Circle");
			System.out.println("2. Rectangle");
			System.out.println("3. Trapezoid");
			System.out.println("4. Triangle");
			System.out.println("5. Exit.\nSelect any one : ");

			choice = scanner.nextInt();
```

```
                switch (choice) {
                    case 1:
                        System.out.println("Enter the radius of the circle:");

Program 2.2	Date: 16/01/2024

Define a class called Rectangle with member variables length and width. Use appropriate member functions to calculate the perimeter and area of the rectangle. Define another member function *int sameArea(Rectangle)* that has one parameter of type Rectangle. *sameArea* returns 1 if the two Rectangles have the same area, and returns 0 if they don't. Use appropriate constructors to initialize the member variables(Use both default and parameterized constructor)

PROGRAM :

```
import java.util.Scanner;

class Rectangle {
	private double length;
	private double width;

	// Default constructor
	public Rectangle() {
		this.length = 0;
		this.width = 0;
	}

	// Parameterized constructor
	public Rectangle(double length, double width) {
		this.length = length;
		this.width = width;
	}

	// Getter methods
	public double getLength() {
		return length;
	}

	public double getWidth() {
		return width;
	}

	// Setter methods
	public void setLength(double length) {
		this.length = length;
	}

	public void setWidth(double width) {
		this.width = width;
	}

	// Method to calculate perimeter
```

```
    public double calculatePerimeter() {
        return 2 * (length + width);
    }

    // Method to calculate area
    public double calculateArea() {
        return length * width;
    }

    // Method to check if two rectangles have the same area
    public int sameArea(Rectangle otherRectangle) {
        if (this.calculateArea() == otherRectangle.calculateArea()) {
            return 1;
        } else {
            return 0;
        }
    }
}

public class P8_2_member_functions {
    public static void main(String[] args) {
        Scanner scanner = new Scanner(System.in);

        // Taking input for first rectangle

Program 2.3	Date: 16/01/2024

Write a main function to create two rectangle objects and display its area and perimeter. Check whether the two Rectangles have the same area and print a message indicating the result. (Use the concept of *this* pointer too)

PROGRAM :

```
import java.util.Scanner;

class Rectangle {
	private double length;
	private double width;

	// Default constructor
	public Rectangle() {
		this.length = 0;
		this.width = 0;
	}

	// Parameterized constructor
	public Rectangle(double length, double width) {
		this.length = length;
		this.width = width;
	}

	// Getter methods
	public double getLength() {
		return length;
	}

	public double getWidth() {
		return width;
	}

	// Setter methods
	public void setLength(double length) {
		this.length = length;
	}

	public void setWidth(double width) {
		this.width = width;
	}

	// Method to calculate perimeter
	public double calculatePerimeter() {
		return 2 * (this.length + this.width); // using this pointer to refer to the instance variables
```

```
    }

    // Method to calculate area
    public double calculateArea() {
        return this.length * this.width; // using this pointer to refer to the instance variables
    }

    // Method to check if two rectangles have the same area
    public boolean sameArea(Rectangle otherRectangle) {
        return this.calculateArea() == otherRectangle.calculateArea();
    }

Program 2.5	Date: 18/01/2024

Define a class called Time that has hours and minutes as integer. The class has the following member function: *Time sum(Time)* to sum two time object & return time a. Use the concept of constructor overloading to initialize the time

2.5.1 Write the definitions for each of the above member functions.

2.5.2 Write main function to create three time objects. Set the value in two objects and call sum() to calculate sum and assign it in third object. Display all time objects. (Use the concept of *this* pointer too)

PROGRAM :

```
import java.util.Scanner;

class Time {
	private int hours;
	private int minutes;

	// Default constructor
	public Time() {
		this.hours = 0;
		this.minutes = 0;
	}

	// Parameterized constructor with hours and minutes
	public Time(int hours, int minutes) {
		this.hours = hours;
		this.minutes = minutes;
	}

	// Getter methods
	public int getHours() {
		return hours;
	}

	public int getMinutes() {
		return minutes;
	}

	// Setter methods
	public void setHours(int hours) {
		this.hours = hours;
	}

	public void setMinutes(int minutes) {
		this.minutes = minutes;
	}

	// Method to sum two Time objects
```

```
    public Time sum(Time other) {
        int totalHours = this.hours + other.getHours();
        int totalMinutes = this.minutes + other.getMinutes();

        // Adjust minutes if they exceed 60
        if (totalMinutes >= 60) {
            totalHours += totalMinutes / 60;
            totalMinutes %= 60;
        }

        return new Time(totalHours, totalMinutes);
    }
    // Method to display the time

Program 2.6	Date: 19/01/2024

Create a class 'Account' with two overloaded constructors. The first constructor is used for initializing the name of account holder, the account number and the initial amount in the account. The second constructor is used for initializing the name of the account holder, the account number, the addresses, the type of account and the current balance. The Account class is having methods Deposit (), Withdraw (), and Get_Balance(). Make the necessary assumption for data members and return types of the methods. Create objects of Account class and use them.

PROGRAM :

```
import java.util.Scanner;

class Account {
	private String accountHolderName;
	private int accountNumber;
	private String address;
	private String accountType;
	private double balance;

	// First constructor
	public Account(String accountHolderName, int accountNumber, double initialAmount)
{
		this.accountHolderName = accountHolderName;
		this.accountNumber = accountNumber;
		this.balance = initialAmount;
	}

	// Second constructor
	public Account(String accountHolderName, int accountNumber, String address, String
accountType, double currentBalance) {
		this.accountHolderName = accountHolderName;
		this.accountNumber = accountNumber;
		this.address = address;
		this.accountType = accountType;
		this.balance = currentBalance;
	}

	// Method to deposit money
	public void deposit(double amount) {
		if (amount > 0) {
			balance += amount;
			System.out.println("Deposit successful. Current balance: " + balance);
		} else {
			System.out.println("Invalid deposit amount.");
		}
	}

	// Method to withdraw money
```

```
    public void withdraw(double amount) {
        if (amount > 0 && amount <= balance) {
            balance -= amount;
            System.out.println("Withdrawal successful. Current balance: " + balance);
        } else {
            System.out.println("Insufficient funds or invalid withdrawal amount.");
        }
    }

    // Method to get current balance
    public double getBalance() {
        return balance;
    }
}

public class P8_6_account {
    public static void main(String[] args) {
        Scanner scanner = new Scanner(System.in);
        // Account objects
        Account account1 = null;
        Account account2 = null;

CYCLE 3: Inheritance, method overloading and overriding, Polymorphism

Program 3.1	Date: 20/01/2024

Write a Java program which creates a class named 'Employee' having the following members: Name, Age, Phone number, Address, Salary. It also has a method named 'print- Salary( )' which prints the salary of the Employee. Two classes 'Officer' and 'Manager' inherits the 'Employee' class. The 'Officer' and 'Manager' classes have data members 'specialization' and 'department' respectively. Now, assign name, age, phone number, address and salary to an officer and a manager by making an object of both of these classes and print the same.

PROGRAM :

```
import java.util.Scanner;

class Employee {
	String name;
	int age;
	String phoneNumber;
	String address;
	double salary;

	public Employee(String name, int age, String phoneNumber, String address, double salary) {
		this.name = name;
		this.age = age;
		this.phoneNumber = phoneNumber;
		this.address = address;
		this.salary = salary;
	}

	public void printSalary() {
		System.out.println("Salary: " + salary);
	}
}

class Officer extends Employee {
	String specialization;

	public Officer(String name, int age, String phoneNumber, String address, double salary, String specialization) {
		super(name, age, phoneNumber, address, salary);
		this.specialization = specialization;
	}
}

class Manager extends Employee {
```

```
    String department;

    public Manager(String name, int age, String phoneNumber, String address, double salary, String department) {
        super(name, age, phoneNumber, address, salary);
        this.department = department;
    }
}

public class P9_1_employee {
    public static void main(String[] args) {
        Scanner scanner = new Scanner(System.in);

        System.out.println("Enter details for Officer:");
        System.out.print("Name: ");

```

Program 3.2	Date: 21/01/2024

Write two Java classes Employee and Engineer. Engineer should inherit from Employee class. Employee class to have two methods display() and calcSalary(). Write a program to display the engineer salary and to display from Employee class using a single object instantiation (i.e., only one object creation is allowed).

- **display() only prints the name of the class and does not return any value. Ex. " Name of class is Employee."**
- **calcSalary() in Employee displays "Salary of employee is 10000" and calcSalary() in Engineer displays "Salary of employee is 20000."**

PROGRAM :

```
import java.util.Scanner;

class Employee {
	public void display() {
		System.out.println("Name of class is Employee.");
	}
	public void calcSalary() {
		System.out.println("Salary of employee is 10000.");
	}
}

class Engineer extends Employee {
	public void calcSalary() {
		System.out.println("Salary of employee is 20000.");
	}
}

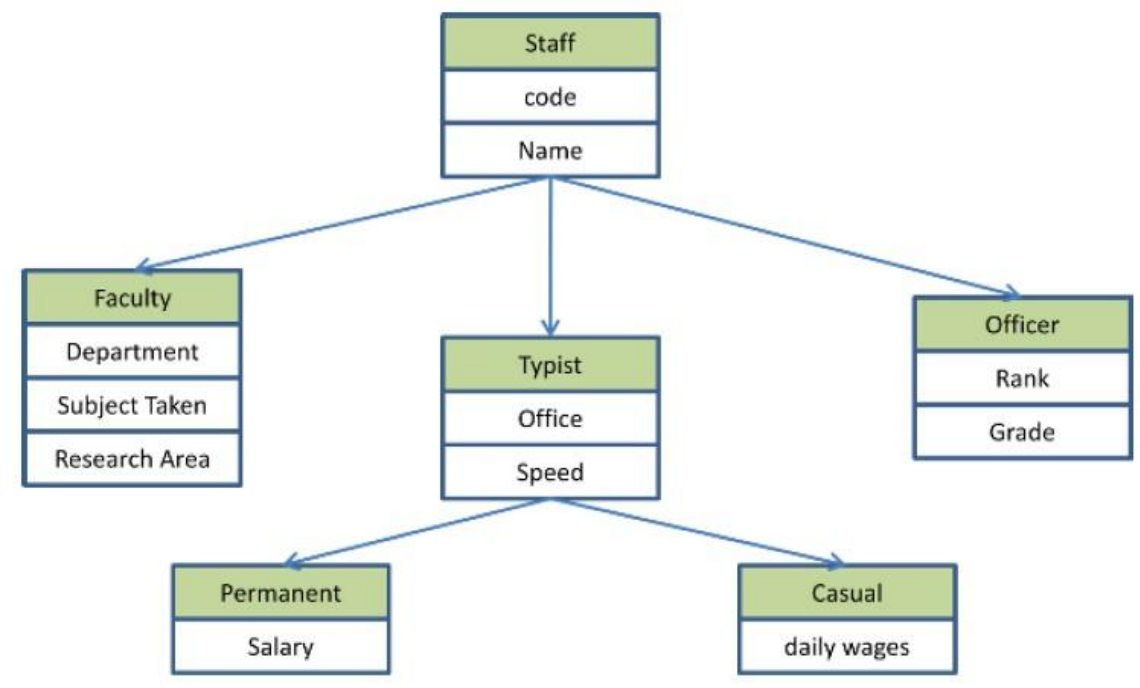
public class P9_2_emp_engineer {
	public static void main(String[] args) {
		Employee emp = new Engineer(); // Polymorphism: Employee reference, Engineer
object
		emp.display(); // Calls display method of Employee class
		emp.calcSalary(); // Calls calcSalary method of Engineer class
	}
}
```

OUTPUT :

```
E:\MCA\SEM     2\JAVA     PROGRAMMING     (MCA202)\JAVA     LAB>java
P9_2_emp_engineer
Name of class is Employee.
Salary of employee is 20000.
```

Program 3.3	Date: 21/01/2024

Write a Java program to implement the following level of inheritance.



PROGRAM :

```
class Staff {
	String code;
	String name;

	public Staff(String code, String name) {
		this.code = code;
		this.name = name;
	}

	public void display() {
		System.out.println("Code: " + code);
		System.out.println("Name: " + name);
	}
}

class Faculty extends Staff {
	String department;
	String subjectTaken;
	String researchArea;

	public Faculty(String code, String name, String department, String subjectTaken, String
researchArea) {
		super(code, name);
		this.department = department;
```

```
        this.subjectTaken = subjectTaken;
        this.researchArea = researchArea;
    }

    public void display() {
        super.display();
        System.out.println("Department: " + department);
        System.out.println("Subject Taken: " + subjectTaken);
        System.out.println("Research Area: " + researchArea);
    }
}

class Typist extends Staff {
    String office;

```

Program 3.4	Date: 22/01/2024

Write a java program to create an abstract class named Shape that contains an empty method named numberOfSides(). Provide three classes named Rectangle, Triangle and Hexagon such that each one of the classes extends the class Shape. Each one of the classes contains only the method numberOfSides( ) that shows the number of sides in the given geometrical structures.

PROGRAM :

```
import java.util.Scanner;

abstract class Shape {
	abstract void numberOfSides();
}

class Rectangle extends Shape {
	@Override
	void numberOfSides() {
		System.out.println("A rectangle has 4 sides.");
	}
}

class Triangle extends Shape {
	@Override
	void numberOfSides() {
		System.out.println("A triangle has 3 sides.");
	}
}

class Hexagon extends Shape {
	@Override
	void numberOfSides() {
		System.out.println("A hexagon has 6 sides.");
	}
}

public class P9_4_abstract_class {
	public static void main(String[] args) {
		Scanner scanner = new Scanner(System.in);

		System.out.println("Enter the name of the shape (Rectangle, Triangle, or Hexagon):");
		String shapeName = scanner.nextLine().toLowerCase();

		Shape shape = null;
		switch (shapeName) {
```

```
                case "rectangle":
                        shape = new Rectangle();
                        break;
                case "triangle":
                        shape = new Triangle();
                        break;
                case "hexagon":
                        shape = new Hexagon();
                        break;
                default:
                        System.out.println("Invalid shape name!");
        }

        if (shape != null) {
                System.out.println("Details of " + shapeName + ":");
                shape.numberOfSides();
        }

        scanner.close();
    }
}
```

OUTPUT :

```
E:\MCA\SEM 2\JAVA PROGRAMMING (MCA202)\JAVA LAB>java
P9_4_abstract_class
Enter the name of the shape (Rectangle, Triangle, or Hexagon):
Rectangle

```

Program 3.5	Date: 22/01/2024

write a program to represent geometric shapes and some operations that can be performed on them. The idea here is that shapes in higher dimensions inherit data from lower dimensional shapes. For example a cube is a three dimensional square. A sphere is a three dimensional circle and a glome is a four dimensional circle. A cylinder is another kind of three dimensional circle. The circle, sphere, cylinder, and glome all share the attribute radius. The square and cube share the attribute side length. There are various ways to use inheritance to relate these shapes but please follow the inheritance described in the table below.
All shapes inherit getName() from the superclass Shape.

Class	Class Variable	Constructor	Extends	Implements
Shape	String name	Shape()		
Circle	double radius	Circle(double r, String n)	Shape	Area
Square	double side	Square(double s, String n)	Shape	Area
Cylinder	double height	Cylinder(double h, double r, String n)	Circle	Volume
Sphere	None	Sphere(double r, String n)	Circle	Volume
Cube	None	Cube(double s, String n)	Square	Volume
Glome	None	Glome(double r, String n)	Sphere	Volume

Note: the volume of a glome is $0.5(\pi^2)r^4$ where r is the radius.

Specification:

Your program will consist of the following classes: Shape, Circle, Square, Cube, Sphere, Cylinder,and Glome and two interfaces Area and Volume

Your classes may only have the class variable specified in the table below and the methods defined in the two interfaces Area and Volume. You will implement the methods specified in the Area and Volume interfaces and have them return the appropriate value for each shape. Class Shape will have a single public method called getName that returns a string.

PROGRAM :

```
import java.util.Scanner;

// Area interface
interface Area {
	double calculateArea();
}

// Volume interface
interface Volume {
	double calculateVolume();
}

// Shape class
class Shape {
	String name;

	public Shape() {
		this.name = "Generic Shape";
	}

	public String getName() {
		return name;
	}
}

// Circle class
class Circle extends Shape implements Area {
	double radius;

	public Circle(double r, String n) {
		this.radius = r;
		this.name = n;
	}

	@Override
	public double calculateArea() {
		return Math.PI * radius * radius;
	}
}

// Square class
class Square extends Shape implements Area {
	double side;

	public Square(double s, String n) {
		this.side = s;
		this.name = n;
	}
```

```
    @Override
    public double calculateArea() {
        return side * side;
    }
}

// Cylinder class
class Cylinder extends Circle implements Volume {
    double height;

    public Cylinder(double h, double r, String n) {
        super(r, n);
        this.height = h;
    }

    @Override
    public double calculateVolume() {
        return Math.PI * radius * radius * height;
    }
}

// Sphere class
class Sphere extends Circle implements Volume {
    public Sphere(double r, String n) {
        super(r, n);
    }

    @Override
    public double calculateVolume() {
        return (4.0 / 3.0) * Math.PI * Math.pow(radius, 3);
    }
}

// Cube class
class Cube extends Square implements Volume {
    public Cube(double s, String n) {
        super(s, n);
    }

    @Override
    public double calculateVolume() {
        return side * side * side;
    }
}

// Glome class
class Glome extends Sphere implements Volume {
    public Glome(double r, String n) {
        super(r, n);
    }
    @Override
    public double calculateVolume() {
        return 0.5 * Math.PI * Math.PI * radius * radius * radius * radius;
```

```
    }
}
public class P9_5_geometric_shapes {

Program 3.6	Date: 23/01/2024

Define an interface "Operations" which has method area(), volume(). Define a constant PI having value 3.14. Create class a Cylinder(with member variable height) which implements this interface. Create one object and calculate area and volume. Add Required Constructors.

PROGRAM :

```
import java.util.Scanner;

// Define interface Operations
interface Operations {
	double PI = 3.14; // constant

	double area(); // method to calculate area
	double volume(); // method to calculate volume
}

// Implementing class Cylinder
class Cylinder implements Operations {
	double height; // member variable

	// Constructor
	public Cylinder(double height) {
		this.height = height;
	}

	// Method to calculate area
	public double area() {
		return 2 * PI * height;
	}

	// Method to calculate volume
	public double volume() {
		return PI * height * height;
	}
}

public class P9_6_interface_operations {
	public static void main(String[] args) {
		Scanner scanner = new Scanner(System.in);

		System.out.print("Enter the height of the cylinder: ");
		double height = scanner.nextDouble();

		Cylinder cylinder = new Cylinder(height); // Creating an object of Cylinder

		// Calculating area and volume
```

```
            double area = cylinder.area();
            double volume = cylinder.volume();

            // Displaying the results
            System.out.println("Area of the cylinder: " + area);
            System.out.println("Volume of the cylinder: " + volume);

            scanner.close();
        }
}
```

OUTPUT :

```
E:\MCA\SEM 2\JAVA PROGRAMMING (MCA202)\JAVA LAB>java

Program 3.7	Date: 23/01/2024

Write a program that illustrates interface inheritance. Interface P is extended by P1 and P2. Interface P12 inherits from both P1 and P2.Each interface declares one constant and one method. class Q implements P12.Instantiate Q and invoke each of its methods. Each method displays one of the constants.

PROGRAM :

```
import java.util.*;

interface P {
	void methodP(); // method declaration
}

interface P1 extends P {
	void methodP1(); // method declaration
}

interface P2 extends P {
	void methodP2(); // method declaration
}

interface P12 extends P1, P2 {
	// No additional constants or methods here
}

class Q implements P12 {
	private int constantP;
	private int constantP1;
	private int constantP2;

	// Constructor to receive constants
	public Q(int constantP, int constantP1, int constantP2) {
		this.constantP = constantP;
		this.constantP1 = constantP1;
		this.constantP2 = constantP2;
	}

	// Implementing method from P1 interface
	public void methodP1() {
		System.out.println("Constant from P1: " + constantP1);
	}

	public void methodP2() {
		System.out.println("Constant from P2: " + constantP2);
	}

	public void methodP() {
		System.out.println("Constant from P: " + constantP);
```

```
    }
}

public class P9_7_interface_inheritance {
    public static void main(String[] args) {
        Scanner scanner = new Scanner(System.in);

        System.out.print("Enter constant value for P: ");
        int constantP = scanner.nextInt();

        System.out.print("Enter constant value for P1: ");
        int constantP1 = scanner.nextInt();

        System.out.print("Enter constant value for P2: ");
        int constantP2 = scanner.nextInt();

        // Instantiating Q with constants passed to its constructor
        Q q = new Q(constantP, constantP1, constantP2);

        q.methodP();
        q.methodP1();
        q.methodP2();

        scanner.close();
    }
}
```

OUTPUT :

Cycle 4: Multithreading

Program 4.1	Date: 25/01/2024

Write a Java program to create two threads: One for displaying all odd number between 1 and 100 and second thread for displaying all even numbers between 1 and 100. Create a multithreaded program by creating a subclass of Thread and then creating, initializing, and starting two Thread objects from your class. The threads will execute concurrently Main thread should wait until all the other thread terminates its execution(using join()).

PROGRAM :

```
class OddThread extends Thread {
	public void run() {
		System.out.println("Odd numbers between 1 and 100:");
		for (int i = 1; i <= 100; i += 2) {
			System.out.print(i + " ");
		}
		System.out.println();
	}
}
class EvenThread extends Thread {
	public void run() {
		System.out.println("Even numbers between 1 and 100:");
		for (int i = 2; i <= 100; i += 2) {
			System.out.print(i + " ");
		}
		System.out.println();
	}
}
public class P10_1_threads {
	public static void main(String[] args) {
		Thread oddThread = new OddThread();
		Thread evenThread = new EvenThread();
		oddThread.start();
		evenThread.start();
		try{
		oddThread.join();
		evenThread.join();
		}catch(InterruptedException e) {
			System.out.println("Main thread interrupted");
		}
		System.out.println("Main thread exiting.");
	}
}
```

OUTPUT :

```
E:\MCA\SEM 2\JAVA PROGRAMMING (MCA202)\JAVA LAB>java P10_1_threads
Even numbers between 1 and 100:
Odd numbers between 1 and 100:
1 3 5 2 4 7 9 6 11 13 8 10 15 12 17 14 19 16 21 23 18 25 27 20 29 22

Program 4.2	Date: 25/01/2024

Write a Java program that set thread priorities and display the priority.

PROGRAM :

```
class MyThread extends Thread {
	public MyThread(String name) {
		super(name);
	}

	public void run() {
		System.out.println("Thread: " + getName() + ", Priority: " + getPriority());
	}
}

public class    P10_2_thread_priority{
	public static void main(String[] args) {
		MyThread thread1 = new MyThread("Thread 1");
		MyThread thread2 = new MyThread("Thread 2");
		MyThread thread3 = new MyThread("Thread 3");

		// Set priorities for threads
		thread1.setPriority(Thread.MIN_PRIORITY); // Minimum priority
		thread2.setPriority(Thread.NORM_PRIORITY); // Normal priority
		thread3.setPriority(Thread.MAX_PRIORITY); // Maximum priority

		// Start threads
		thread1.start();
		thread2.start();
		thread3.start();
	}
}
```

OUTPUT :

```
E:\MCA\SEM 2\JAVA PROGRAMMING (MCA202)\JAVA LAB>java

```

Program 4.3	Date: 25/01/2024

Write a java program that implements a multi-thread application that has three threads. The first thread generates random integer every 1 second and if the value is even, second thread computes the square of the number and prints. If the value is odd, the third thread will print the value of cube of the number

PROGRAM :

```
import java.util.Random;

class RandomNumberGenerator extends Thread {
	public void run() {
		Random random = new Random();
		while (true) {
			int randomNumber = random.nextInt(100); // Generating random integer between 0 and 99
			System.out.println("Generated Number: " + randomNumber);
			try {
				Thread.sleep(1000); // Sleep for 1 second
			} catch (InterruptedException e) {
				e.printStackTrace();
			}
			if (randomNumber % 2 == 0) {
				// If the random number is even, notify the square thread
				synchronized (SquareThread.lock) {
					SquareThread.number = randomNumber;
					SquareThread.lock.notify();
				}
			} else {
				// If the random number is odd, notify the cube thread
				synchronized (CubeThread.lock) {
					CubeThread.number = randomNumber;
					CubeThread.lock.notify();
				}
			}
		}
	}
}

class SquareThread extends Thread {
	public static final Object lock = new Object();
	public static int number;

	public void run() {
		while (true) {
```

```
                synchronized (lock) {
                    try {
                        lock.wait();
                    } catch (InterruptedException e) {
                        e.printStackTrace();
                    }
                    int square = number * number;
                    System.out.println("Square of " + number + " is: " + square);
                }
            }
        }
}

class CubeThread extends Thread {

Program 4.4	Date: 25/01/2024

Write a program to illustrate creation of threads using runnable interface. (start method start each of the newly created thread. Inside the run method there is sleep() for suspend the thread for 500 milliseconds). Main thread should wait until all the other thread terminates its execution (using join()).

PROGRAM :

```
import java.util.Scanner;

class MyRunnable implements Runnable {
	public void run() {
		try {
			System.out.println(Thread.currentThread().getName() + " is running.");
			Thread.sleep(500);
		} catch (InterruptedException e) {
			e.printStackTrace();
		}
	}
}

public class P10_4_thread_runnable {
	public static void main(String[] args) {
		Scanner scanner = new Scanner(System.in);
		System.out.print("Enter the number of threads: ");
		int numThreads = scanner.nextInt();
		scanner.close();

		Thread[] threads = new Thread[numThreads];

		for (int i = 0; i < numThreads; i++) {
			threads[i] = new Thread(new MyRunnable());
			threads[i].start();
		}

		for (Thread thread : threads) {
```

```
                try {
                    thread.join();
                } catch (InterruptedException e) {
                    e.printStackTrace();
                }
            }

            System.out.println("All threads have terminated.");
        }
}
```

OUTPUT :

Program 4.5	Date: 25/01/2024

Write a java program showing a typical invocation of banking operations via multiple threads. Create three threads and 2 methods deposit and withdraw methods to add the amount to the account and withdraw an amount from the account respectively. As the threads concurrently run the method, avoid the unpredictable behavior. (Use synchronization).

PROGRAM :

```
import java.util.Scanner;

class BankAccount {
	private int balance;
	public BankAccount(int initialBalance) {
		balance = initialBalance;
	}

	// Synchronized method to deposit amount into the account
	public synchronized void deposit(int amount) {
		System.out.println(Thread.currentThread().getName() + " is depositing $" + amount);
		balance += amount;
		System.out.println("New balance after deposit by " + Thread.currentThread().getName() + ": $" + balance);
	}

	// Synchronized method to withdraw amount from the account
	public synchronized void withdraw(int amount) {
		System.out.println(Thread.currentThread().getName() + " is withdrawing $" + amount);
		if (balance >= amount) {
			balance -= amount;
			System.out.println("New balance after withdrawal by " + Thread.currentThread().getName() + ": $" + balance);
		} else {
			System.out.println("Insufficient balance for withdrawal by " + Thread.currentThread().getName());
		}
	}
}
```

```
public class P10_5_banking {
	public static void main(String[] args) {
		Scanner scanner = new Scanner(System.in);
		System.out.print("Enter initial balance: ");
		int initialBalance = scanner.nextInt();

		// Creating a bank account with initial balance entered by the user
		BankAccount account = new BankAccount(initialBalance);

		System.out.print("Enter deposit amount: ");
		int depositAmount = scanner.nextInt();
		System.out.print("Enter withdrawal amount: ");
		int withdrawalAmount = scanner.nextInt();
		scanner.close();

		// Creating three threads performing deposit and withdrawal operations
		Thread thread1 = new Thread(() -> {
			account.deposit(depositAmount);
		}, "Thread-1");

		Thread thread2 = new Thread(() -> {
			account.withdraw(withdrawalAmount);
		}, "Thread-2");

		Thread thread3 = new Thread(() -> {
			account.deposit(depositAmount);
		}, "Thread-3");

		// Starting all threads
		thread1.start();
		thread2.start();
		thread3.start();
	}
}
```

OUTPUT :

```
E:\MCA\SEM 2\JAVA PROGRAMMING (MCA202)\JAVA LAB>java P10_5_banking
Enter initial balance: 50000
Enter deposit amount: 25000
Enter withdrawal amount: 3000
Thread-1 is depositing $25000
New balance after deposit by Thread-1: $75000

Program 5.3	Date: 27/01/2024

Write a Java program that reads a set of real numbers from a file and displays the minimum,maximum, average, and range of the numbers in the file. The user should be able to enter the name of the input file from the keyboard.

PROGRAM :

```
import java.io.File;
import java.io.FileNotFoundException;
import java.util.Scanner;

public class P11_3_realnum {

	public static void main(String[] args) {
		Scanner scanner = new Scanner(System.in);
		System.out.print("Enter the name of the input file: ");
		String fileName = scanner.nextLine();

		try {
			File file = new File(fileName);
			Scanner fileScanner = new Scanner(file);

			double sum = 0;
			double min = Double.MAX_VALUE;
			double max = Double.MIN_VALUE;

			while (fileScanner.hasNextDouble()) {
				double num = fileScanner.nextDouble();
				sum += num;
				if (num < min) {
					min = num;
				}
				if (num > max) {
					max = num;
				}
			}
```

```
            fileScanner.close();

            int count = 0;
            double range = max - min;

            System.out.println("Minimum: " + min);
            System.out.println("Maximum: " + max);
            System.out.println("Average: " + (sum / count));
            System.out.println("Range: " + range);

        } catch (FileNotFoundException e) {
            System.out.println("File not found: " + fileName);
        }
    }
}
```

OUTPUT :

```
E:\MCA\SEM 2\JAVA PROGRAMMING (MCA202)\JAVA LAB>java P11_3_realnum
Enter the name of the input file: newout.txt
Minimum: 1.0
Maximum: 5.0
Average: Infinity
Range: 4.0

```

Program 5.4	Date: 27/01/2024

Write a program that reads the contents of a file and creates an exact copy of the file, except that each line is numbered. For example, if the input file contains the following text:

Two roads diverged in a yellow wood,
And sorry I could not travel both
And be one traveler, long I stood
And looked down one as far as I could
To where it bent in the undergrowth;

then the output file should appear something like this:

1: Two roads diverged in a yellow wood,
2: And sorry I could not travel both
3: And be one traveler, long I stood
4: And looked down one as far as I could
5: To where it bent in the undergrowth;

PROGRAM :

```
import java.io.BufferedReader;
import java.io.BufferedWriter;
import java.io.FileReader;
import java.io.FileWriter;
import java.io.IOException;
import java.io.InputStreamReader;

public class P11_4_copy {
	public static void main(String[] args) {
		try (BufferedReader reader = new BufferedReader(new
InputStreamReader(System.in))) {
			System.out.print("Enter the input file name: ");
			String inputFileName = reader.readLine();

			System.out.print("Enter the output file name: ");
			String outputFileName = reader.readLine();
```

```
                createNumberedCopy(inputFileName, outputFileName);
            } catch (IOException e) {
                System.err.println("An error occurred while reading user input: "
+ e.getMessage());
                e.printStackTrace();
            }
        }

        public static void createNumberedCopy(String inputFileName, String
outputFileName) {
            try (BufferedReader reader = new BufferedReader(new
FileReader(inputFileName));
                 BufferedWriter writer = new BufferedWriter(new
FileWriter(outputFileName))) {

                String line;
                int lineNumber = 1;
                while ((line = reader.readLine()) != null) {
                    writer.write(lineNumber + ": " + line);
                    writer.newLine();
                    lineNumber++;
                }

                System.out.println("Numbered copy created successfully.");
            } catch (IOException e) {
                System.err.println("An error occurred while creating numbered
copy: " + e.getMessage());
                e.printStackTrace();
            }
        }
}
```

OUTPUT :

```
E:\MCA\SEM 2\JAVA PROGRAMMING (MCA202)\JAVA LAB>java P11_4_copy
Enter the input file name: out1.txt
Enter the output file name: out1copy.txt
Numbered copy created successfully.
```

Program 5.5	Date: 27/01/2024

Write a Java program that reads a line of integers, and then displays each integer, and the sum of all the integers. (Use StringTokenizer class of java.util)

PROGRAM :

```
import java.util.Scanner;
import java.util.StringTokenizer;

public class P11_5_lineof_integer {

	public static void main(String[] args) {
		Scanner scanner = new Scanner(System.in);

Program 5.8	Date: 27/01/2024

Write a Java program to define a class salesman with the attributes name, salesman code, sales amount and commission(use user inputs). The Company calculates the commission of a salesman according to the following formula:

(i) 8% if sales &<=2000
(ii) 10% sales if sales>=2000 and but <=5000
(iii)12% if sales exceeds 5000

Create salesman objects and find the commission of sales. Generate and handle exceptions if sales amount is less than 0.

PROGRAM :

```
import java.util.Scanner;

class P11_8_salesman {
	private String name;
	private int salesmanCode;
	private double salesAmount;
	private double commission;

	public P11_8_salesman(String name, int salesmanCode, double salesAmount) {
		this.name = name;
		this.salesmanCode = salesmanCode;
		this.salesAmount = salesAmount;
		calculateCommission();
	}

	private void calculateCommission() {
		if (salesAmount < 2000) {
			commission = salesAmount * 0.08; // 8% commission
		} else if (salesAmount >= 2000 && salesAmount <= 5000) {
			commission = salesAmount * 0.10; // 10% commission
		} else {
			commission = salesAmount * 0.12; // 12% commission
```

```
        }
    }

    public void display() {
        System.out.println("Salesman Name: " + name);
        System.out.println("Salesman Code: " + salesmanCode);
        System.out.println("Sales Amount: " + salesAmount);
        System.out.println("Commission: " + commission);
    }

    public static void main(String[] args) {
        Scanner scanner = new Scanner(System.in);

        System.out.print("Enter Salesman Name: ");
        String name = scanner.nextLine();

        System.out.print("Enter Salesman Code: ");
        int salesmanCode = scanner.nextInt();

        System.out.print("Enter Sales Amount: ");
        double salesAmount = scanner.nextDouble();

        P11_8_salesman salesman = new P11_8_salesman(name,
salesmanCode, salesAmount);
        System.out.println("\nSalesman Details:");
        salesman.display();

        scanner.close();

			Connection con = DriverManager.getConnection(url, username, password);

			// Define the SQL query with parameter
			String deleteQuery = "DELETE FROM Emp WHERE esal < ?";

			// Create prepared statement
			PreparedStatement pstmt = con.prepareStatement(deleteQuery);

			// Set parameter value
			pstmt.setDouble(1, 10000); // Deleting records with salary less than 10,000

			// Execute the delete operation
			int rowsDeleted = pstmt.executeUpdate();

			System.out.println(rowsDeleted + " records deleted successfully.");

			// Close resources
```

```
            pstmt.close();
            con.close();
        } catch (SQLException e) {
            e.printStackTrace();
        }
    }
```

OUTPUT :

```
E:\MCA\SEM 2\JAVA PROGRAMMING (MCA202)\JAVA LAB>
Java DeleteRecordsExample

0 records deleted successfully.
```

Program 7.7	Date: 12/03/2024

Implement a JDBC program which uses a Stored Procedure to insert records into Department table.

PROGRAM :

PROCEDURE:

```
/*CREATE OR REPLACE PROCEDURE insert_department(
	dno_param IN INT,
	dname_param IN VARCHAR2,
	dloc_param IN VARCHAR2
)
AS
BEGIN
	INSERT INTO Department(dno, dname, dloc) VALUES(dno_param, dname_param, dloc_param);
	COMMIT;
END;
/*/
```

SOURCE CODE:

```
import java.sql.CallableStatement;
import java.sql.Connection;
import java.sql.DriverManager;
import java.sql.SQLException;

public class InsertDepartmentExample {
	public static void main(String[] args) {
		String url = "jdbc:oracle:thin:@localhost:1521:orcl";
		String username = "mca";
		String password = "mca";

		try {
			// Establish connection
			Connection con = DriverManager.getConnection(url, username, password);
```

```
            // Define the SQL call to stored procedure
            String sql = "{ call insert_department(?, ?, ?) }";

            // Create CallableStatement
            CallableStatement cstmt = con.prepareCall(sql);

            // Set parameter values
            cstmt.setInt(1, 1);                 // dno
            cstmt.setString(2, "IT");       // dname
            cstmt.setString(3, "New York"); // dloc

            // Execute stored procedure
            cstmt.execute();

            System.out.println("Record inserted successfully.");

            // Close resources
            cstmt.close();
            con.close();
        } catch (SQLException e) {
            e.printStackTrace();
        }
    }
}
```

OUTPUT :

```
E:\MCA\SEM 2\JAVA PROGRAMMING (MCA202)\JAVA LAB>
Java InsertDepartmentExample

Record inserted successfully.
```

Program 7.8	Date: 12/03/2024

Use Callable statement to implement a Stored Procedure to display the Ename and Salary of all employees.

PROGRAM :

PROCEDURE:

```
/*CREATE OR REPLACE PROCEDURE display_employees_info
AS
BEGIN
	FOR emp_rec IN (SELECT ename, esal FROM Emp) LOOP
		DBMS_OUTPUT.PUT_LINE('Employee Name: ' || emp_rec.ename ||
', Salary: ' || emp_rec.esal);
	END LOOP;
END;
/*/
```

SOURCE CODE:

```
import java.sql.CallableStatement;
import java.sql.Connection;
import java.sql.DriverManager;
import java.sql.SQLException;

public class DisplayEmployeesInfo {
	public static void main(String[] args) {
		String url = "jdbc:oracle:thin:@localhost:1521:orcl";
		String username = "mca";
		String password = "mca";

		try {
			// Establish connection
			Connection con = DriverManager.getConnection(url, username,
password);

			// Define the SQL call to stored procedure
			String sql = "{ call display_employees_info }";
```

```
            // Create CallableStatement
            CallableStatement cstmt = con.prepareCall(sql);

            // Execute stored procedure
            cstmt.execute();

            // Close resources
            cstmt.close();
            con.close();
        } catch (SQLException e) {
            e.printStackTrace();
        }
    }
}
```

OUTPUT :

```
E:\MCA\SEM 2\JAVA PROGRAMMING (MCA202)\JAVA LAB>
Java DisplayEmployeesInfo

Stored procedure executed successfully.
```

Program 7.9	Date: 12/03/2024

Write a JDBC program to implement Transaction Management in the Department table.

PROGRAM :

```
import java.sql.Connection;
import java.sql.DriverManager;
import java.sql.SQLException;
import java.sql.Statement;

public class TransactionExample {
	public static void main(String[] args) {
		String url = "jdbc:oracle:thin:@localhost:1521:orcl";
		String username = "mca";
		String password = "mca";

		Connection con = null;
		Statement stmt = null;

		try {
			// Establish connection
			con = DriverManager.getConnection(url, username, password);
			con.setAutoCommit(false); // Disable auto-commit mode

			// Create a Statement object
			stmt = con.createStatement();

			// Perform multiple database operations within the transaction
			stmt.executeUpdate("INSERT INTO Department VALUES
(101, 'IT', 'New York')");
			stmt.executeUpdate("INSERT INTO Department VALUES
(102, 'HR', 'London')");

			// Commit the transaction
			con.commit();
			System.out.println("Transaction committed successfully.");
		} catch (SQLException e) {
```

```
                try {
                    // Rollback the transaction if any exception occurs
                    if (con != null) {
                        con.rollback();
                        System.out.println("Transaction rolled back successfully.");
                    }
                } catch (SQLException ex) {
                    ex.printStackTrace();
                }
                e.printStackTrace();
            } finally {
                try {
                    // Close resources
                    if (stmt != null) {
                        stmt.close();
                    }
                    if (con != null) {
                        con.close();
                    }
                } catch (SQLException e) {
                    e.printStackTrace();
                }

        }
}
```

OUTPUT :

```
E:\MCA\SEM 2\JAVA PROGRAMMING (MCA202)\JAVA LAB>
Java TransactionExample

Transaction committed successfully.
```

Program 7.10	Date: 12/03/2024

Write a JDBC program to depict the usage of SQLException Class and SQLWarning Class

PROGRAM :

```
import java.sql.Connection;
import java.sql.DriverManager;
import java.sql.ResultSet;
import java.sql.SQLException;
import java.sql.Statement;

public class SQLExceptionExample {
	public static void main(String[] args) {
		String url = "jdbc:oracle:thin:@localhost:1521:orcl";
		String username = "mca";
		String password = "mca";

		try {
			// Establish connection
			Connection con = DriverManager.getConnection(url, username,
password);

			// Create a Statement object
			Statement stmt = con.createStatement();

			// Execute a query that may cause SQLException
			ResultSet rs = stmt.executeQuery("SELECT * FROM
NonExistentTable");

			// Handle SQLWarning
			SQLWarning warning = stmt.getWarnings();
			if (warning != null) {
				System.out.println("SQLWarning occurred:");
				while (warning != null) {
					System.out.println("Message: " +
warning.getMessage());
					System.out.println("SQLState: " +
warning.getSQLState());
```

```
                    System.out.println("Error code: " +
warning.getErrorCode());
                    warning = warning.getNextWarning();
                }
            }

            // Close resources
            rs.close();
            stmt.close();
            con.close();
        } catch (SQLException e) {
            // Handle SQLException
            System.out.println("SQLException occurred:");
            System.out.println("Message: " + e.getMessage());

Error code: 942
```

Cycle 8: Graphics Programming

Program 8.1	Date: 18/03/2024

Write a Java program that works as a simple calculator. Arrange Buttons for digits and the + - * % operations properly. Add a text field to display the result. Handle any possible exceptions like divide by zero. Use Java Swing.

PROGRAM :

```
import javax.swing.*;
import java.awt.*;
import java.awt.event.ActionEvent;
import java.awt.event.ActionListener;

public class P14_1_calculator extends JFrame implements ActionListener {
	private JTextField textField;
	private JButton[] buttons;
	private String[] buttonLabels = {
			"7", "8", "9", "/",
			"4", "5", "6", "*",
			"1", "2", "3", "-",
			"0", ".", "=", "+",
			"Clear", "%"
	};
	private double num1, num2, result;
	private char operator;

	public P14_1_calculator() {
		setTitle("Calulator ans");
		setSize(300, 400);
		setDefaultCloseOperation(JFrame.EXIT_ON_CLOSE);
		setLocationRelativeTo(null);

		textField = new JTextField();
		// textField.setEditable(false);

		JPanel buttonPanel = new JPanel(new GridLayout(5, 4));

		buttons = new JButton[buttonLabels.length];
		for (int i = 0; i < buttonLabels.length; i++) {
```

```
            buttons[i] = new JButton(buttonLabels[i]);
            buttons[i].addActionListener(this);
            buttonPanel.add(buttons[i]);
        }

        add(textField, BorderLayout.NORTH);
        add(buttonPanel, BorderLayout.CENTER);
    }

    @Override
    public void actionPerformed(ActionEvent e) {
        String command = e.getActionCommand();
        try {
            switch (command) {
                case "Clear":
                    textField.setText("");
                    break;
                case "=":

Program 8.2	Date: 12/03/2024

Write a Java program that simulates a traffic light. The program lets the user select one of three lights: red, yellow, or green. When a radio button is selected, the light is turned on, and only one light can be on at a time. No light is on when the program starts.

PROGRAM :

```
import javax.swing.*;
import java.awt.*;
import java.awt.event.*;

public class P14_2_traffic_light extends JFrame implements ActionListener
{
	private JRadioButton redButton, yellowButton, greenButton;
	private JPanel trafficPanel, buttonPanel;
	private ButtonGroup buttonGroup;

	public P14_2_traffic_light() {
		setTitle("Traffic Light Simulator");
		setSize(200, 400);
		setDefaultCloseOperation(JFrame.EXIT_ON_CLOSE);

		trafficPanel = new JPanel() {
			@Override
			protected void paintComponent(Graphics g) {
				super.paintComponent(g);
				drawTrafficLight(g);
			}
		};
		trafficPanel.setPreferredSize(new Dimension(100, 300));

		buttonPanel = new JPanel();
		buttonPanel.setLayout(new GridLayout(3, 1));

		redButton = new JRadioButton("Red");
		redButton.addActionListener(this);

		yellowButton = new JRadioButton("Yellow");
		yellowButton.addActionListener(this);

		greenButton = new JRadioButton("Green");
```

```
        greenButton.addActionListener(this);

        buttonGroup = new ButtonGroup();
        buttonGroup.add(redButton);
        buttonGroup.add(yellowButton);
        buttonGroup.add(greenButton);

        buttonPanel.add(redButton);
        buttonPanel.add(yellowButton);
        buttonPanel.add(greenButton);

        add(trafficPanel, BorderLayout.CENTER);
        add(buttonPanel, BorderLayout.EAST);

        setVisible(true);
    }

    private void drawTrafficLight(Graphics g) {
        int diameter = 50;
        int centerX = (trafficPanel.getWidth() - diameter) / 2;
        int startY = 20;

        g.setColor(Color.black);
        g.fillOval(centerX, startY, diameter, diameter);
        g.fillOval(centerX, startY + diameter + 10, diameter, diameter);
        g.fillOval(centerX, startY + (diameter + 10) * 2, diameter,
diameter);

        if (redButton.isSelected()) {

Cycle 10: Capstone Project

PROJECT	Date: 18/03/2024
Hotel Management System	

1. Introduction :

The Hotel Management System is designed to automate and streamline various operations involved in managing hotel reservations and room occupancy. The system offers functionalities such as making reservations, canceling reservations, finding rooms for guests, viewing all reservations, and displaying available rooms. Implemented in Java with a MySQL database backend, the system provides a user-friendly graphical interface for seamless interaction.

2. Aim :

The aim of this project is to create a Hotel Management System that facilitates various operations such as making reservations, canceling reservations, finding rooms for guests, viewing all reservations, and displaying available rooms. The system aims to streamline the management of hotel reservations and room occupancy efficiently.

3. Technologies used :

- Java: For developing the application logic and graphical user interface.
- Swing: Java GUI toolkit for creating windows, buttons, text fields, and other UI components.
- MySQL: Relational database management system for storing reservation and room information.
- JDBC: Java Database Connectivity API for integrating Java applications with MySQL database.

4. Functionalities :

- Make Reservation: Allows users to make a reservation by providing guest name and the number of guests. Assigns an available room to the reservation and provides a unique reservation ID upon successful booking.
- Cancel Reservation: Enables users to cancel a reservation by providing the reservation ID. Frees up the room assigned to the reservation.
- Find Room: Allows users to find the room number associated with a guest's name. Searches through existing reservations to locate the room for the specified guest.

- ✧ View All Reservations: Displays all reservations made in the system, including reservation ID, guest name, room number, and number of guests.
- ✧ View Available Rooms: Displays all available rooms that are not currently booked, helping users identify vacant rooms for reservation.
